

About Device42

Device42 software provides a 'single pane of glass' for IT infrastructure that allows organizations to maintain up-to-date inventories of their physical, virtual, and cloud services and containers, network components, software, services, applications, and their inter-relationships and inter-dependencies.

Diagramming Challenges

Device42 had been using another software product, but found shortcomings with diagram scalability performance that could not always sufficiently meet their high standards. They needed a solution that could generate diagrams at a reasonable speed, especially at scale, with the ability to be manipulated in real-time.

The GoJS Solution

As they began their search, "high quality paid support, ease of integration, scalability, and a diverse selection of grouping and charting styles" were high priority. The team found themselves "hitting a wall in the time it took to handle and manipulate diagrams" with other solutions.

However, by taking advantage of the GoJS unlimited evaluation period, they were able to fully appreciate how GoJS could meet their needs. Transitioning from one software solution to another can be difficult, but the Device42 team had no problems switching to GoJS.

"It's a simple and straightforward product; no real hurdles, and it essentially worked as a drop-in." Support has been **"pleasant with quick replies"** when they've needed it, but they haven't run into many problems with their integration and use of GoJS.

The biggest reason the Device42 team would recommend GoJS to another organization?
"We haven't found its limits yet."

GoJS is a leading JavaScript and TypeScript library for building interactive diagrams. GoJS makes it easy to construct interactive diagrams of Nodes, Links, and Groups, with customizable templates and layouts.
